Preparation Sheet for Mosquitoes and Ticks

- Please pick up any children or pet toys and remove them from any areas to be treated.
- There should be a clear path of access for the exterminator to inspect and treat any areas where pests have been identified.
- All windows to your home should remain closed and any running air conditioning units should be turned off temporarily for the duration of the treatment.
- Any areas with standing water such as: bucket lids, old tires, clogged gutters must be removed and/or cleaned to prevent mosquito breeding sites.
- Any harborage areas (stored items or overgrown vegetation) should be removed or cut back from the areas to be sprayed before treatment if possible to eliminate any areas for the pests hide and to allow enough space for the exterminator to safely perform the treatment.
- Please let us know if anyone in the home has any special allergy problems, is pregnant, or is under the age of one because additional precautions may need to be taken.
- **All people and pets must leave the area to be treated before the treatment starts and remain out of the treated area for at least 4 hours after the treatment is completed.**
